

RTutor.ai Quick-Start Guide

Frequency Tables and Bar Graphs
Rayhan Driver and V.N. Vimal Rao

0) Setup

This guide uses the Grade Interaction dataset.

1. Upload the dataset in RTutor.ai under **(1. Data)** → **Browse**.
2. Confirm four columns: *Year-in-School*, *Major*, *Format*, *Grade*.
3. Under **(2. Data Types)** → **Edit**, set Year-in-School, Major, and Format = Category, and Grade = Integer (or Numeric).

1) Frequency Table

Goal: Create a frequency table showing the count of students in each level of Format (In-Person vs Online).

Your prompt to RTutor.ai must:

1. Reference the Grade Interaction dataset and the variable Format.
2. Ask for a frequency table (count of students in each category of Format).
3. Request that the table also show proportions or percentages alongside the counts.

Check: Does the table list each Format category with its count and percentage? Do the counts add up to the total number of students?

2) Bar Graph

Goal: Create a bar graph displaying the frequency of each Format category.

Your prompt must include:

1. Specify the Grade Interaction dataset and the variable Format.
2. Say “bar graph” (not histogram, not density plot). A bar graph is for categorical data; a histogram is for quantitative data.
3. Request a y-axis label of “Count” (or “Frequency”), font size 14, and a color palette of your choice.

Check: Is each bar a separate category (not bins of a continuous variable)? Do the bar heights match the counts from your frequency table?

3) Interpretation & Extension

1. Write 1–2 sentences: Which Format category has the most students? Are the groups roughly balanced or is one much larger?
2. Repeat the workflow (frequency table + bar graph) for a different categorical variable (Major or Year-in-School) and write the same interpretation.
